

## Linear Regression with independent data

Consider the usual regression model

$$y_i = \underbrace{x_i' \beta}_{k \times 1} + \underbrace{u_i}_{k \times 1}$$

### Identification

(i)  $E x_i u_i = 0$

(ii)  $E x_i x_i'$  has full rank  $k$ .

Then  $E x_i (y_i - x_i' \beta_0) = 0$

$$\Rightarrow E x_i y_i = E x_i x_i' \beta$$

$$\Rightarrow \beta = (E x_i x_i')^{-1} E x_i y_i$$

The proposed estimator is the sample analogue :

$$\hat{\beta}_n = \left( \frac{1}{n} \sum_{i=1}^n x_i x_i' \right)^{-1} \frac{1}{n} \sum_{i=1}^n x_i y_i$$

### Asymptotic Theory

Lemma 1 :- (from Portmanteau Theorem) Convergence in distribution of random vectors in  $\mathbb{R}^k$ ,  $x_n \xrightarrow{d} x$ , is equivalent to

$$\lim_{n \rightarrow \infty} E h(x_n) = E h(x) \quad \text{for every continuous functional } h(\cdot).$$

(Intuition : CDF converge if all the moments converge)

Lemma 2 :- a) (Monotone Convergence) If  $x_n \geq 0$ , monotonic and for each  $w \in \Omega$ ,  $\lim_{n \rightarrow \infty} x_n(w) = x(w)$ . Then

$$\lim_{n \rightarrow \infty} E x_n = E X$$

b) (Fatou's Lemma) If  $x_n \geq 0$ , then

$$E (\liminf_{n \rightarrow \infty} x_n) \leq \liminf_{n \rightarrow \infty} E X$$

c) (Dominated Convergence) Suppose that for each  $w \in \Omega$ ,  
 $\lim_{n \rightarrow \infty} E X_n = EX$ . Furthermore, there is some  $Y$  such that  
 $E Y < \infty$  and  $|X_n| \leq Y$  for each  $n \geq 1$ . Then

$$\lim_{n \rightarrow \infty} E X_n = EX$$

Lemma 3 :- We say

$$X_n \xrightarrow{d} X \iff \text{for all open } G \subset \mathbb{R}^d,$$

**A**

$$\liminf_{n \rightarrow \infty} P\{X_n \in G\} \geq P\{X \in G\}$$

**B**

Proof : Consider sufficiency first. We assume that **B** holds. Then take some continuous function  $f(\cdot)$  and write

$$\begin{aligned} E f(X) &= \int_0^\infty P\{f(X) > t\} dt \\ &\stackrel{\text{by B}}{\leq} \int_0^\infty \liminf_{n \rightarrow \infty} P\{f(X_n) > t\} dt \\ &\stackrel{\substack{\text{by dominated convergence} \\ \text{with dominating function} \\ Y = 1.}}{\leq} \liminf_{n \rightarrow \infty} \int_0^\infty P\{f(X_n) > t\} dt \\ &= \liminf_{n \rightarrow \infty} E f(X_n) \end{aligned}$$

Now take some bounded continuous function  $h(\cdot)$  such that  $|h| \leq c < \infty$ . This requires that  $c + h(\cdot) \geq 0$  and  $c - h(\cdot) \geq 0$ . Then

$$\begin{aligned} \bullet \quad c + E h(X) &\leq c + \liminf_{n \rightarrow \infty} E(X_n) \\ \Rightarrow \quad E h(X) &\leq \liminf_{n \rightarrow \infty} E(X_n) \\ \bullet \quad c - E h(X) &\leq c - \liminf_{n \rightarrow \infty} E(X_n) \\ \Rightarrow \quad E h(X) &\geq \limsup_{n \rightarrow \infty} E(X_n) \end{aligned}$$

So we conclude that  $\lim_{n \rightarrow \infty} E h(X_n) = E h(X)$ . By Lemma 2 our result follows.

For necessity take a continuous nonnegative  $f_j(X) \leq \mathbb{1}_{\{X \in G\}}$  such that  $f_j(\cdot) \rightarrow \mathbb{1}_{\{\cdot \in G\}}$  as  $j \rightarrow \infty$ . Then the result follows from Fatou's Lemma. ■

Theorem 2. - (Continuous Mapping) Let  $\{x_n\}$  be a sequence of random vectors in  $\mathbb{R}^d$  such that  $x_n \xrightarrow{P} x$ . Also, let  $g(\cdot)$  be an  $\mathbb{R}^k$ -valued function on  $\mathbb{R}^d$  that is continuous on a set  $C$  such that  $P\{x \in C\} = 1$  (i.e. almost everywhere). Then

$$g(x_n) \xrightarrow{P} g(x) \quad \text{as } n \rightarrow \infty.$$

proof: Assume  $x_n \xrightarrow{P} x$ . We want to show  $P\{g(x) \in G\} \leq \liminf_{n \rightarrow \infty} P\{g(x_n) \in G\}$  where  $G$  is an open set in  $\mathbb{R}^d$ .

Suppose  $g^{-1}(G) \cap C$  is empty. Then

$$\begin{aligned} P\{g(x) \in G\} &= P[\{g(x) \in G\} \cap \{x \in C\}] \\ &= P[x \in g^{-1}(G) \cap C] = 0 \\ &\leq \liminf_{n \rightarrow \infty} P\{g(x_n) \in G\} \text{ is trivially true.} \end{aligned}$$

Suppose  $g^{-1}(G) \cap C$  is non-empty. Then choose a point  $v \in g^{-1}(G) \cap C$ . There must be an open ball  $N_v$  such that  $g(w) \in G$  for all  $w \in N_v$ . This means that  $N_v \subset g^{-1}(G)$ . Thus  $g^{-1}(G) \cap C = \underbrace{g^{-1}(G)^o}_{\text{interior of } g^{-1}(G)}$

Using this result we write

$$\begin{aligned} P\{\bar{x} \in g^{-1}(G)\} &= P\{x \in g^{-1}(G) \cap C\} \\ &\leq P\{x \in g^{-1}(G)^o\} \\ &\leq \liminf_{n \rightarrow \infty} P\{x_n \in g^{-1}(G)^o\} \\ &\leq \liminf_{n \rightarrow \infty} P\{x_n \in g^{-1}(G)\}. \end{aligned}$$

by Lemma 1, the result follows.

Lemma 4. - (Slutsky's Theorem) Suppose that a sequence of random vectors  $x_n \xrightarrow{P} x$  and let  $h(\cdot)$  be continuous almost everywhere. Then  $h(x_n) \xrightarrow{P} h(x)$ .

proof: We want to show that  $\limsup_{n \rightarrow \infty} P\{|h(x_n) - h(x)| > \epsilon\} = 0$ . Write

$$\begin{aligned} P(|h(x_n) - h(x)| > \epsilon) &= P(|h(x_n) - h(x)| > \epsilon, \|x_n - x\| \geq f_\epsilon) + \\ &\quad P(|h(x_n) - h(x)| > \epsilon, \|x_n - x\| < f_\epsilon) \end{aligned}$$

because continuity implies that the second term is zero

$$\begin{aligned}
 &= P(\|h(x_n) - h(x)\| > \varepsilon, \|x_n - x\| \geq \delta_\varepsilon) \\
 &\leq P(\|x_n - x\| \geq \delta_\varepsilon) \\
 &= P(o_p(1) \geq \delta_\varepsilon)
 \end{aligned}$$

Taking limit yields

$$\limsup_{n \rightarrow \infty} P(\|h(x_n) - h(x)\| > \varepsilon) \leq \limsup_{n \rightarrow \infty} P(o_p(1) \geq \delta_\varepsilon) = 0.$$

Theorem 2 :- (iid Weak Law of Large Numbers) Let  $\{X_n\}$  be a sequence of iid random vectors such that  $E\|X_i\| < \infty$ . Then

$$\frac{1}{n} \sum_{i=1}^n X_i \xrightarrow{P} EX_i$$

proof: Denote the characteristic function of  $X_i$  as  $\varphi(t) := E[\exp(jt X_i)]$ , where  $j = \sqrt{-1}$ . Write

$$\begin{aligned}
 \varphi_n(t) &= E \left[ \exp \left( jt \sum_{i=1}^n X_i \right) \right] \\
 &= E \left[ \prod_{i=1}^n \exp \left( jt \frac{X_i}{n} \right) \right] \\
 &\stackrel{\text{by indep}}{=} \prod_{i=1}^n E \left[ \exp \left( jt \frac{X_i}{n} \right) \right] \\
 &\stackrel{\text{by id}}{=} \left\{ E \left[ \exp \left( jt \frac{X_i}{n} \right) \right] \right\}^n \\
 &= \{\varphi(t/n)\}^n.
 \end{aligned}$$

By a Taylor approximation around  $t=0$  :

$$\varphi(t/n) = \underbrace{\varphi(0)}_{=1} + \frac{t'}{n} E[j X_i] + \underbrace{o(t)}_{=o(\frac{1}{n})}$$

Then

$$\begin{aligned}
 \lim_{n \rightarrow \infty} \varphi_n(t) &= \lim_{n \rightarrow \infty} \left\{ 1 + jt' \frac{E[X_i]}{n} + o\left(\frac{1}{n}\right) \right\}^n \\
 &= \exp(jt' E[X_i]).
 \end{aligned}$$

By Levy's continuity theorem we conclude that

$$\frac{1}{n} \sum_{i=1}^n X_i \xrightarrow{d} E[X_i] \quad \text{which implied convergence in probability because it's a degenerate distribution.}$$

Theorem 3. - (i.i.d Weak Law of Large Numbers) Suppose that  $\{X_n\}$  is a sequence of mean zero random vectors in  $\mathbb{R}^k$  such that  $E X_i, E X_j, m = 0$  for all  $i \neq j$ ,  $i \in \{1, 2, \dots, k\}$  and  $m \in \{1, 2, \dots, k\}$ . Moreover,

$$\frac{1}{n} \max_{1 \leq j \leq n} E \|X_j\|^2 = o(1)$$

then

$$\frac{1}{n} \sum_{i=1}^n X_i \xrightarrow{P} 0.$$

proof: Write

$$\begin{aligned} P\left(\left\|\frac{1}{n} \sum_{i=1}^n X_i\right\| > \varepsilon\right) &\stackrel{\text{Markov ineq}}{\leq} E\left[\left\|\frac{1}{n} \sum_{i=1}^n X_i\right\|^2\right] \frac{1}{\varepsilon^2} \\ &= E\left[\frac{1}{n^2} \sum_{i=1}^n \|X_i\|^2\right] \frac{1}{\varepsilon^2} \\ &\leq \frac{1}{n^2} n \max_{1 \leq j \leq n} E \|X_j\|^2 \\ &= o(1) \end{aligned}$$

Then the result follows from taking limit as  $n \rightarrow \infty$  on both sides.

Theorem 4. - (i.i.d Central Limit) Suppose  $\{X_n\}$  are a sequence of i.i.d random vectors such that  $E \|X_i\|^2 < \infty$  and  $\text{Var}(X_i) = \Sigma$  and non singular. Then,

$$\frac{1}{\sqrt{n}} \sum_{i=1}^n (X_i - E X_i) \xrightarrow{d} N(0, \Sigma)$$

proof:

We can use Levy's continuity theorem for the univariate case and use the Cramer-Wold device to extend it to random vectors. I'll omit the details of this proof.

### Consistency

- (i) Data  $\{y_i, x_i'\}$  is iid
- (ii)  $E x_i u_i = 0$
- (iii)  $E x_i x_i'$  has full rank  $n$ .

Then

$$\hat{\beta}_n = \beta + o_p(1)$$

Proof:

$$\begin{aligned}
 \hat{\beta}_n &= \beta + \left( \frac{1}{n} \sum_{i=1}^n x_i x_i' \right)^{-1} \frac{1}{n} \sum_{i=1}^n x_i u_i \\
 &= \beta + \left( \frac{1}{n} \sum_{i=1}^n x_i x_i' - E x_i x_i' + E x_i x_i' \right)^{-1} \underbrace{\frac{1}{n} \sum_{i=1}^n (x_i u_i + E x_i u_i - E x_i u_i)}_{=0} \\
 &\stackrel{\text{Theorem 3}}{=} \beta + \left[ o_p(1) + E x_i x_i' \right]^{-1} \left[ o_p(1) + \underbrace{E x_i u_i}_{=0} \right] \\
 &\stackrel{\text{Lemma 4}}{=} \beta + \left[ o_p(1) + (E x_i x_i')^{-1} \right] o_p(1) \\
 &= \beta + o_p(1). \quad \blacksquare
 \end{aligned}$$

### Asymptotic Normality

- (i) Data  $\{y_i, x_i'\}$  is iid
- (ii)  $E x_i u_i = 0$
- (iii)  $E x_i x_i'$  has full rank  $n$ .
- (iv)  $E x_{ij}^4 < \infty$  for  $j=1, \dots, k$ .
- (v)  $E u_i^4 < \infty$
- (vi)  $\text{Var}(x_i u_i)$  is positive definite

Lemma 5. - Provided (iv) - (vi) hold. Then  $\text{Var}(x_i u_i) = O(1)$ .

Proof:  $\text{Var}(x_i u_i) = E(u_i^2 x_i x_i')$

$$\begin{aligned}
& \stackrel{\text{Cauchy-Schwarz}}{\leq} \{E |u_i|^4 E \|x_i x_i'\|^2\}^{1/2} \\
& = \{E |u_i|^4 E (\text{tr}(x_i x_i' x_i x_i'))\}^{1/2} \\
& \stackrel{\text{Frobenius Norm}}{=} \{E |u_i|^4 E (x_i' x_i)^2\}^{1/2} \\
& \text{Recall } \|x_i\| = (x_i' x_i)^{1/2} \\
& = \{E |u_i|^4 E \|x_i\|^4\}^{1/2} \\
& = \{E |u_i|^4 E [\sum_{j=1}^k x_{ij}^2]^2\}^{1/2} \\
& \text{for some constant } C \leq \{E |u_i|^4 C \max_{1 \leq j \leq k} E [x_{ij}^4]\}^{1/2} \\
& = O(1) \cdot O(1) \\
& = O(1) \quad .
\end{aligned}$$

Now assume all conditions (i)-(vi) hold. Then

$$\sqrt{n}(\hat{\beta}_n - \beta) \xrightarrow{d} N(0, (E x_i x_i')^{-1} \text{Var}(x_i u_i) (E x_i x_i')^{-1})$$

proof:

First, notice that with Lemma 5 and Theorem 4 we have

$$\begin{aligned}
& \frac{1}{\sqrt{n}} \sum_{i=1}^n x_i u_i \xrightarrow{d} N(0, \text{Var}(x_i u_i)) \\
& \text{i.e. } \frac{1}{\sqrt{n}} \sum_{i=1}^n x_i u_i = O_p(1).
\end{aligned}$$

Then, we write

$$\begin{aligned}
\sqrt{n}(\hat{\beta}_n - \beta) & = \left( \frac{1}{n} \sum_{i=1}^n x_i x_i' \right)^{-1} \frac{1}{\sqrt{n}} \sum_{i=1}^n x_i u_i \\
& = \left[ (E x_i x_i')^{-1} + o_p(1) \right] \frac{1}{\sqrt{n}} \sum_{i=1}^n x_i u_i
\end{aligned}$$

$$\begin{aligned}
&= (\mathbb{E} \mathbf{x}_i \mathbf{x}_{i'}')^{-1} \frac{1}{\sqrt{n}} \sum_{i=1}^n x_i u_i + o_p(1) \frac{1}{\sqrt{n}} \sum_{i=1}^n x_i u_i \\
&\stackrel{\text{Theorem 4}}{=} (\mathbb{E} \mathbf{x}_i \mathbf{x}_{i'})^{-1} \frac{1}{\sqrt{n}} \sum_{i=1}^n x_i u_i + o_p(1) O_p(1) \\
&= (\mathbb{E} \mathbf{x}_i \mathbf{x}_{i'})^{-1} \frac{1}{\sqrt{n}} \sum_{i=1}^n x_i u_i + o_p(1). \\
&\xrightarrow{d} \mathbb{E}(\mathbf{x}_i \mathbf{x}_{i'})^{-1} N(0, \text{Var}(x_i u_i)) \\
&= N(0, (\mathbb{E} \mathbf{x}_i \mathbf{x}_{i'})^{-1} \text{Var}(x_i u_i) \mathbb{E}(\mathbf{x}_i \mathbf{x}_{i'})) \\
&= N(0, V).
\end{aligned}$$

### Estimation of Asymptotic Variance Matrix

Let  $\hat{M}_n = \frac{1}{n} \sum \mathbf{x}_i \mathbf{x}_{i'}'$ ,  $\hat{\Omega}_n = \frac{1}{n} \sum_{i=1}^n \hat{u}_i^2 \mathbf{x}_i \mathbf{x}_{i'}$ ,  $\hat{u}_i = y_i - \mathbf{x}_i' \hat{\beta}_n$ .

We propose the following estimator of the asymptotic variance  $V$ :

$$\hat{V}_n = \hat{M}_n^{-1} \hat{\Omega}_n \hat{M}_n^{-1}.$$

First, consider

$$\begin{aligned}
\hat{\Omega}_n &= \frac{1}{n} \sum_{i=1}^n \hat{u}_i^2 \mathbf{x}_i \mathbf{x}_{i'}' \\
&= \frac{1}{n} \sum_{i=1}^n [(\mathbf{y}_i - \mathbf{x}_i' \hat{\beta}_n \pm \mathbf{x}_i' \beta)^2 \mathbf{x}_i \mathbf{x}_{i'}'] \\
&= \frac{1}{n} \sum_{i=1}^n \hat{u}_i^2 \mathbf{x}_i \mathbf{x}_{i'}' + \frac{1}{n} \sum_{i=1}^n [\mathbf{x}_i' (\hat{\beta}_n - \beta)]^2 \mathbf{x}_i \mathbf{x}_{i'}' - \frac{2}{n} \sum_{i=1}^n [\mathbf{x}_i' (\hat{\beta}_n - \beta) \hat{u}_i] \mathbf{x}_i \mathbf{x}_{i'}' \\
&= \mathcal{R} + o_p(1) + R_{1n} + R_{2n}
\end{aligned}$$

$$\begin{aligned}
\|\mathcal{R}_{1n}\| &\leq \frac{1}{n} \sum_{j=1}^n |\mathbf{x}_i' (\hat{\beta}_n - \beta)|^2 \|\mathbf{x}_i\|^2 \\
&\leq \|\hat{\beta}_n - \beta\|^2 \frac{1}{n} \sum_{j=1}^n \|\mathbf{x}_i\|^2 \|\mathbf{x}_i\|^2 \\
&= o_p(1) \frac{1}{n} \sum_{j=1}^n \|\mathbf{x}_i\|^4
\end{aligned}$$

$$\begin{aligned}
&= o_p(1) \left[ E \|x_i\|^4 + o_p(1) \right] \\
&= o_p(1) [ O(1) + o_p(1) ] \\
&= o_p(1).
\end{aligned}$$

$$\begin{aligned}
\bullet \|R_{2n}\| &\leq \|\beta_n - \beta\| \frac{1}{n} \sum_{i=1}^n |u_i| \|x_i\| \|x_i x_i'\| \\
&\leq \|\beta_n - \beta\| \frac{1}{n} \sum_{i=1}^n |u_i| \|x_i\|^3 \\
&= o_p(1) \left[ E |u_i| \|x_i\|^3 + o_p(1) \right] \\
&\leq o_p(1) \left[ (E |u_i|^2 \|x_i\|^2)^{1/2} (E \|x_i\|^4)^{1/2} + o_p(1) \right] \\
&\leq o_p(1) \left[ (\sqrt{E |u_i|^4 E \|x_i\|^4})^{1/2} (E \|x_i\|^4)^{1/2} + o_p(1) \right] \\
&= o_p(1) [ O(1) O(1) + o_p(1) ] \\
&= o_p(1).
\end{aligned}$$

Putting it all together yields

$$\hat{\Sigma}_n = \Sigma + o_p(1).$$

Finally, write

$$\begin{aligned}
\hat{\Sigma}_n &= M_n^{-1} \hat{\Sigma}_n M_n^{-1} \\
&= [(E x_i x_i')^{-1} + o_p(1)] [\Sigma + o_p(1)] [(E x_i x_i')^{-1} + o_p(1)] \\
&= (E x_i x_i')^{-1} \Sigma E (x_i x_i')^{-1} + o_p(1) \\
&\quad \text{because } (E x_i x_i')^{-1} = O(1) \\
\Sigma &= O(1) = V + o_p(1). \quad \blacksquare
\end{aligned}$$
